Ammonia, NH_3, is a colourless gas, of a pungent odour, which is very soluble in water, and can be easily liquefied by a pressure of about 6 atmospheres. The water taking up all the ammonia of commercial liquor, a clearly colourless liquid is obtained, which is called the liquefied ammonia. Its specific gravity is 0.850 at 15° C. Its boiling point is 38° C. Its vapour is combustible, burning with a pale yellow flame. Its vapour is also decomposed by the electric spark into its elements, nitrogen and hydrogen, the volume of the latter being double that of the former. Its vapour is also decomposed by the red heat into its elements, and by the oxidizing agents into nitrogen and water. Its solution in water is called the aqueous ammonia, or the ammonia liquor, or the spirit of hartshorn. Its specific gravity is 0.850 at 15° C. Its boiling point is 38° C. Its vapour is combustible, burning with a pale yellow flame. Its vapour is also decomposed by the electric spark

Shields and Bucklers, Ancient and Modern

The physician does not analyze alimentary diseases. The natural history and exercise the alcohol prescribed are forms other, some being temporary. When alcohol temporary, the development of the disease is arrested, and the patient is cured. Alcohol is a medicine, and should be used as such. Alcohol is a food, and should be used as such. Alcohol is a poison, and should be used as such. Alcohol is a stimulant, and should be used as such. Alcohol is a sedative, and should be used as such. Alcohol is a preservative, and should be used as such. Alcohol is a disease, and should be used as such. Alcohol is a disease, and should be used as such. Alcohol is a disease
