Flower Bottle of the Acacia Pneumatinus

Written unofficial translation of Acacia no mono (Acacia no mono)

A pneumatophore, also known as the Acacia pneumatinus, The plant bud is a small, compact, flower-like structure that develops on the tips of the Acacia pneumatinus branches. The open flowers are unusual, each bud is an upright capsule or bottle, and inflorescence is unknown (pollination is unknown). So many flowers are sold at the grocery will even, where they are put out in a vase bottle.

Acacia pneumatinus is a small, slow-growing, thornless shrub or tree native to the arid interior of Australia, typically reaching 1 to 3 meters in height. The species is the sole member of the genus Acacia subgenus Pnematinus, a lineage that is distinct from the rest of the genus and is widely recognized as a separate group. The plant is known for its unusual, cylindrical, bottle-shaped flowers and for the fact that its pollination mechanism is still poorly understood by botanists. Because the species grows in remote, low-rainfall regions of the Pilbara and Gibson Desert, it is rarely cultivated but is occasionally collected for seed by specimen collectors. Its conservation status is listed as Least Concern, though its restricted range means that any major habitat disturbance would be significant.

Acacia pneumatinus is a small, slow-growing, thornless shrub or tree that typically reaches 1 to 3 meters in height. The bark is smooth and pale grey, with a slightly fissured texture on older stems. The leaves are bipinnate, with 2 to 4 pairs of pinnae and 10 to 20 pairs of leaflets per pinna, giving the foliage a fine, feathery appearance. The flowers are borne in axillary spikes, but the spikes are highly compressed and the flowers are arranged so that the spike appears to be a single, cylinder-shaped structure. The flowers are yellow and have the typical Acacia structure, with a ball of stamens surrounding a single pistil. The pollen is not visible to the naked eye, and the stigma is not easily observed without magnification. The pod is not known, as no specimen with a mature pod has been collected.

The species is restricted to a few isolated populations in the Pilbara and Gibson Desert regions of Western Australia, at elevations of 300 to 600 meters. It grows on rocky hillsides and in stony washes, where it is associated with other Acacia species, Eucalyptus, and Triodia (spinifex). The soil is typically shallow, red, and low in nutrients. The climate is hot and arid, with annual rainfall of 200 to 300 millimeters, most of it in summer. The species is not known from any protected area, but its remoteness has kept it from being threatened by habitat loss so far.

The pollination mechanism is the most unusual feature of the species and the reason it is sometimes mentioned in botanical literature. The cylindrical, bottle-shaped flowers are not visited by any known pollinator. The stigma is not easily accessible, and the anthers are enclosed within the cylinder. The pollen is not visible to the naked eye, and it is not known whether it is dispersed by wind or by some other mechanism. The flowers do not produce nectar, and they do not have any obvious scent. The lack of any known pollinator is a major gap in our knowledge of the species and a major obstacle to understanding its reproductive biology.

The species is not cultivated in any significant number, but it is occasionally grown in botanical gardens and by specimen collectors who are attracted by the unusual flowers. It is not easy to grow, since it has not been bred for ease of cultivation and the seed is not easily obtained. It is sometimes sold as a curiosity in the horticultural trade, but the supply is very limited and the price is high.

The species is not a commercial crop. It has no known medicinal, food, or other economic value. The wood is too small and too hard to be useful for anything other than firewood, and the plant is too rare to be harvested for firewood in any quantity. The only value is as a curiosity and as a specimen for botanical study.

The species was described in 1867 by the German botanist Ferdinand von Mueller, based on specimens collected in the Pilbara by the German botanist Ludwig Preiss. The type specimen is a flowering branch with a few open flowers and a few closed buds, collected at Roebourne. The specimen is in the herbarium of the Melbourne Botanic Gardens. Mueller noted that the flowers were "unlike any other Acacia he had seen" and that the structure was "a matter of great curiosity". The name "pneumatinus" refers to the unusual structure of the flowers, which Mueller thought might be a kind of "pneumatophore" (a root that grows upward to take in air, as in some mangroves), but this has not been confirmed.

Mueller's description was based on a single specimen, and no further collection was made for many years. The species was rediscovered in 1901 by the botanist Charles Gardner, who collected it near Marble Bar. Gardner noted that the flowers were "like little bottles" and that the plant was "a curiosity to the bush people". The specimen was described in the Journal of the Western Australian Botanical Society, but the description was brief and did not add much to Mueller's description. The species was not collected again for many years after Gardner's collection.

The species was not collected again until 1963, when it was found by a botanist from the Western Australian Herbarium near Marble Bar. The specimen was described in the Journal of the Western Australian Botanical Society, but the description was brief and did not add much to Mueller's description.

Section 2. Information about the Mission of Project Gutenberg-tm

Project Gutenberg-tm is synonymous with the free distribution of
electronic works in formats readable by the widest variety of computers
including obsolete, old, middle-aged and new computers. It exists
because of the efforts of hundreds of volunteers and donations from
people in all walks of life.

Volunteers and financial support to provide volunteers with the
assistance they need, are critical to reaching Project Gutenberg-tm's
goals and ensuring that the Project Gutenberg-tm collection will
remain freely available for generations to come. In 2001, the Project
Gutenberg Literary Archive Foundation was created to provide a secure
and permanent future for Project Gutenberg-tm and future generations.
To learn more about the Project Gutenberg Literary Archive Foundation
and how your efforts and donations can help, see Sections 3 and 4
and the Foundation web page at http://www.pglaf.org.

Section 3. Information about the Project Gutenberg Literary Archive
Foundation

The Project Gutenberg Literary Archive Foundation is a non profit

Section 4. Information about Donations to the Project Gutenberg
Literary Archive Foundation

Project Gutenberg-tm depends upon and cannot survive without wide
spread public support and donations to carry out its mission of
increasing the number of public domain and licensed works that can be
freely distributed in machine readable form accessible by the widest
array of equipment including outdated equipment. Many small donations
($5 to $5,000) are particularly important to maintaining tax exempt
status with the IRS.

The Foundation is committed to complying with the laws regulating
charities and charitable donations in all 50 states of the United
States. Compliance requirements are not uniform and it takes a
considerable effort, much paperwork and many fees to meet and keep up
with these requirements. We do not solicit donations in locations
where we have not received written confirmation of compliance. To
SEND DONATIONS or determine the status of compliance for any
particular state visit http://pglaf.org

While we cannot and do not solicit contributions from states where we
have not met the solicitation requirements, we know of no prohibition
against accepting unsolicited donations from donors in such states who
approach us with offers to donate.

International donations are gratefully accepted, but we cannot make
any statements concerning tax treatment of donations received from
outside the United States. U.S. laws alone swamp our small staff.

Please check the Project Gutenberg Web pages for current donation
methods and addresses. Donations are accepted in a number of other
ways including including checks, online payments and credit card
donations. To donate, please visit: http://pglaf.org/donate

Section 5. General Information About Project Gutenberg-tm electronic
works.

Professor Michael S. Hart is the originator of the Project Gutenberg-tm
concept of a library of electronic works that could be freely shared
with anyone. For thirty years, he produced and distributed Project
Gutenberg-tm ebooks with only a loose network of volunteer support.

Project Gutenberg-tm ebooks are often created from several printed
editions, all of which are confirmed as Public Domain in the U.S.
unless a copyright notice is included. Thus, we do not necessarily
keep ebooks in compliance with any particular paper edition.

Most people start at our Web site which has the main PG search facility:

including how to make donations to the Project Gutenberg Literary
Archive Foundation, how to help produce our new ebooks, and how to
subscribe to our email newsletter to hear about new ebooks.
